What this document *covers*

01

Eight signals to remember

02

Understand before deciding

03

The issue overwhelming the debate

04

A ranking concealing two stories

05

Visibility does not provide immunity

06

The strongest link in the relational graph

07

Where the debate is actually taking place

08

What these signals change for each audience

09

What this reading cannot establish

Eight signals to *remember*

Buildfluence launches Morocco's first political intelligence platform during the 2026 legislative campaign. Based on 8,993 real unique URLs collected between 29 July and 5 August 2026, the public prototype shows an electoral debate dominated by the Sebta crisis, saturated with negative tone, and governed by a strong methodological choice: no composite score until it is fully validated.

55%

negative tone •
citizen opinion

1,285

Sebta / migration
mentions

-89

corruption narrative
balance

81%

measured digital
debate in French

01

Sebta / migration concentrates 27% of measured thematic occurrences and records a -67 balance.

02

Corruption is the most polarised issue: 752 mentions and a -89 balance.

03

RNI leads by volume with 187 URLs and +28.9; PJD records -46.6.

04

Aziz Akhannouch is the most visible leader, with 51 URLs and a -43.1 balance.

Four additional *signals*

05

PJD-Justice is the strongest actor-issue association, with 105 documented co-occurrences.

06

46% of the Citizen Opinion corpus comes from Twitter/X, compared with 28% from online press.

07

Buildfluence publicly declines to publish an unvalidated composite score and documents five separate indicators.

08

4,446 of 5,498 Citizen Opinion URLs are in French, revealing a major language asymmetry.

A constructed reading, *not a guess*

The Political Intelligence Platform transforms deduplicated public data into separate, traceable indicators: visibility, tone, narratives and documented interactions. Every reading states its scope, formula and limits.

01

Collection and eligibility control

02

URL deduplication

03

**Actor, issue and tone
classification**

04

**Separate indicators and
documentary relations**

An interaction describes an observed association in the corpus. It demonstrates neither alliance, causality nor confirmed political influence.

2,540 raw Party & Leader rows; 42 ineligible rows excluded; 438 duplicates removed; 2,060 unique URLs retained.
Citizen Opinion: 7,132 rows reduced to 5,498 unique URLs, with 98 tone conflicts arbitrated.

From sources to indicators: an *explainable chain*

The platform separates data origin, processing and published measures. This makes it possible to establish what was actually observed before drawing any decision implication.

Sources

National and international press, digital media, public social networks and documented open sources.

Collection

Eligibility checks, period and scope controls, URL normalization and deduplication.

Enrichment

Actor, issue, channel, language and tone classification, with conflicts explicitly arbitrated.

Indicators

Visibility, narrative balance, thematic exposure, relational centrality and narrative influence remain separate measures.

A documented signal becomes decision intelligence only when its source, transformation, formula and limits remain traceable.

The platform does not merge these measures into a composite score until the methodology is fully validated.

Sebta / migration overwhelms the *debate*

Among seven documented issues, Sebta / migration leads with 1,285 occurrences, far ahead of water and drought (790) and corruption (752). Seventy-four per cent of its occurrences are negative.
